(57) Abstract : This paper addresses the issue of robustly stabilizing along with attaining $H^\infty$ control pertaining to a specific type of discretely switched nonlinear networked control systems (SNNCSs) with non-fragile controllers and sampled data. A state feedback controller is developed through a combination of average dwell time in conjunction with multiple Lyapunov function methods. This controller guarantees robust exponential stability around the equilibrium point having a mentioned disturbance attenuation level ( $\gamma > 0$ ), accounting for all potential uncertain ties. Exponential stabilization conditions, expressed as linear matrix inequalities (LMIs), are derived by the construction of an appropriate Lyapunov-Krasovskii functional (LKF). These results are proven numerically.

**Abstract**

The (2R,3S,4S,5R)-2-(6-amino-2-fluoropurin-9-yl)-5-(hydroxymethyl)oxolane-3,4-diol was synthesized and characterized by FT-IR, FT-Raman and UV-Visible spectroscopic techniques. The computational and structural parameters of the synthesized complexes were determined in order to establish their thermodynamic stability/chemical reactivity of the synthesized complexes. Density Functional Theory (DFT) method was employed to calculate the molecular geometry and vibrational frequencies of the synthesized complexes using B3LYP hybrid functional at 6-311++G(d,p) level of basis set. Global reactivity descriptors helps to explain the bioactivity of complexes hence, were calculated from the HOMO-LUMO energies. The interaction was also studied by molecular docking, and the results were in good agreement with the results obtained experimentally.

**Keywords:** FT-IR; FT-Raman; UV-Visible; DFT; HOMO; LUMO
